`monospace`

Denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.

monospace

Denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.

Denotes arguments to monospace text where the argument is to be replaced by a specific value.

`monospace bold`

Denotes language keywords when used outside example code.

<and>

Chapter 1

Introduction to BBR

This chapter provides information on Base Boot Requirements (BBR).

It contains the following sections:

- [1.1 Abbreviations](#) on page 1-10.
- [1.2 About the Base Boot Requirements](#) on page 1-11.

1.1 Abbreviations

This section lists the abbreviations used in this document.

Table 1-1 Abbreviations and expansion

Abbreviation	Expansion
ACS	Architecture Compliance Suite
ACPI	Advanced Configuration and Power Interface
BBR	Base Boot Requirements
BSA	Base System Architecture
EBBR	Embedded Base Boot Requirements
FWTS	Firmware Test Suite
PSCI	Power State Coordination Interface
SCT	Self-Certification Tests
SBBR	Server Base Boot Requirements
SMBIOS	System Management BIOS
SMCCC	SMC Calling Convention
UEFI	Unified Extensible Firmware Interface

1.2 About the Base Boot Requirements

This section provides information on BBR and the runtime executable environments.

BBR for boot and runtime services are based on Arm 64-bit architecture, that system software, for example operating systems and hypervisors, can rely on.

A driver-based model for advanced platform capabilities beyond basic system configuration and boot is required. However, this model is beyond the scope of this document. Fully discoverable and describable peripherals aid the implementation of this type of a driver model. BBR identifies the Arm and industry standard firmware interfaces applicable to the Arm 64-bit architecture. They include the PSCI, SMCCC, UEFI, ACPI, SMBIOS, and DT interfaces. Requirements that are based on these interfaces are specified. In addition, various recipes are created to accommodate the various operating systems and hypervisors.

The BBR test suites check for compliance against the Server Base Boot Requirements (SBBR) or Embedded Base Boot Requirements (EBBR) specification. Similar to the BSA tests, these tests are also delivered through two runtime executable environments:

1. Self-Certification Tests (SCT)
2. Firmware Test Suite (FWTS)

For more information, see [BBR specification](#).

Chapter 2

Self-Certification Tests

This chapter provides information on SCTs and the tests that are required to run it.

It contains the following section:

- [2.1 Introduction to SCT on page 2-13.](#)

2.1 Introduction to SCT

SCT examines the UEFI implementation requirements defined by the BBR recipes SBBR or EBBR.

For more information, see [SCT](#).

This section contains the following subsection:

- [2.1.1 Running SCT on page 2-13](#).

2.1.1 Running SCT

This section provides information on how to run SCT.

The UEFI SCTs are built as part of the test suite. Running UEFI SCTs is now automated. You can choose to skip the automated SCTs by pressing any key when the UEFI shell prompts.

Shell > Press any key to stop the UEFI SCT running

To run SCT manually, follow these steps:

1. Shell > FS(X):>cd EFI\BOOT\bbr\SCT
2. To run SBBR or EBBR tests: FS(X):EFI\BOOT\bbr\SCT>SCT -s <ebbr.seq/sbbr.seq>
3. To run all tests: FS(X):EFI\BOOT\bbr\SCT>SCT -a -v

Note

Ensure that the system time is correct before starting the SCTs.

You can also select and run tests individually. For more information on running the tests, see [SCT User Guide](#).

See [Chapter 4 Building SCT and FWTS on page 4-16](#), for the steps to build SCT for SBBR or EBBR recipes.

Chapter 3

Firmware Test Suite

This chapter provides information on FWTS, steps to run the tests, and to build FWTS.

It contains the following section:

- [3.1 Introduction to FWTS on page 3-15.](#)

3.1 Introduction to FWTS

Firmware Test Suite (FWTS) is a package that is hosted by Canonical. FWTS provides tests for Advanced Configuration and Power Interface (ACPI), SMBIOS, and UEFI. Several SBBR requirements are tested through FWTS.

For more information, see [FWTS](#).

This section contains the following subsection:

- [3.1.1 Running FWTS on page 3-15](#).

3.1.1 Running FWTS

To run FWTS manually, the built image must be first copied to the bin directory Linux file system.

To run FWTS on the Linux prompt, follow these steps:

1. For SBBR, use the following command:

```
#/bin/fwts -r stdout -q --sbbbr
```

2. For EBBR, use the following command:

```
#/bin/fwts uefirtmisc uefirttime uefirtvariable securebootcert uefirtauthvar  
uefivarinfo esrt uefibootpath
```

Chapter 4

Building SCT and FWTS

This chapter provides information on how to build SCT and FWTS tests.

It contains the following section:

- [4.1 Building SCT and FWTS on page 4-17.](#)

4.1 Building SCT and FWTS

This section describes how to build SCT and FWTS for EBBR and SBBR recipes.

The SystemReady ACS live image contains all the BBR ACS tests. However, for debug and verification of bug-fixes, the following steps enable the user to build SCT and FWTS images independently.

Following are the steps to build SCT and FWTS:

1. Clone BBR repository:

```
git clone ssh://ap-gerrit-1.ap01.arm.com:29418/avk/syscomp_bbr bbr-acs
```

2. Get the source code:

```
cd bbr-acs/<ebbr/sbbr>/scripts  
./build-scripts/get_<ebbr/sbbr>_source.sh
```

3. Build BBR ACS from the scripts directory run:

```
./build-scripts/build_<ebbr/sbbr>.sh
```

The script applies patches to create EBBR or SBBR to build recipe in the SCT / FWTS build system. It copies over new files to support the new tests and to run or start up a sequence.

The generated image of SCT can be found in bbr-acs/<ebbr/sbbr>/scripts/edk2-test/uefi-sct/<ARCH>_SCT which is the AARCH64_SCT.

The generated image of FWTS can be found in bbr-acs/<ebbr/sbbr>/scripts/fwts/fwts_output.
